

MyBlackBook Releases VDNNote to Help Assist in Maintaining an Active, Healthy Sex Life

MyBlackBook, the Internet's first secure and confidential on-line sexual history tracker, has just released a new tool that assists in maintaining a healthy active sex life.

New York, NY (PRWEB) March 15, 2006 -- MyBlackBook (<http://www.myblackbook.org>), the Internet's first secure and confidential on-line sexual history tracker, has just released a new tool that assists in maintaining a healthy active sex life.

The new tool called VDNNote, short for "Venereal Disease Notification", is linked to a user's MyBlackBook account – analyzing the account and giving each user the probability of obtaining a sexually transmitted disease such as chlamydia or herpes, based on a combination of national averages and their own sexual history.

The tool gives real-time information to the user and shows them the probability of obtaining several sexually transmitted diseases, along with both the site and national averages, so a user can see if they are above or below the current averages of obtaining a venereal disease.

VDNNote is just one of the many other features that MyBlackBook has to offer which also includes features such as charts, graphs, reports and more – all in real time, and all for free.

The mission of MyBlackBook (<http://www.myblackbook.org>) is to provide its members with a place to store their sexual history, partners, and experiences in a safe, secure and confidential place. MyBlackBook allows members to manage, update and lookup their entries in an easy way - giving them the opportunity and ability to assess their sexual behavior and activity and, if desired, to make changes in their life. The addition of VDNNote to MyBlackBook's service helps simplify the task of modifying sexual habits by actually computing the risks involved with having unprotected sex and the like.

All transmissions through MyBlackBook are aided by a 128-Bit SSL Secure Server, to protect the privacy and the information passed from the user to the server. The service is completely free to use, but members must be at least 18 years of age, due to the nature of the service.

MyBlackBook hopes that the addition of this new service, VDNNote, will spark a trend in getting people to be more aware of their sexual behavior – possibly reducing the spread of sexually transmitted diseases, and creating a safer sexual environment for all.

MyBlackBook, which debuted April 15th, 2005, has over 750 active members taking charge of their sex life, and who now have the ability to make any necessary changes to stay healthy and disease free. MyBlackBook is owned by Resorb Networks, Inc. - a small on-line company that creates radical and never-before-seen applications for the web.
